U.S. Application No. 09/940,985

T-495 P.003

Amendments to the Specification

Please replace the paragraph on Page 16, beginning on line 2, with the following amended paragraph.

As a method of calculation, <u>an</u> addition chain method or the like is often adopted (refer to "Angouriron Nyuumon" ("<u>E. Okamoto, An Introduction to the Theory of Cryptography, published by Kyoritsu shuppan on February 25, 1993 (pages 94-97)")); however, with such an algorithm processing speed is slow, and the time required for a transaction utilizing an IC card may exceed the user's allowable time. Therefore, it is the CRT to produce M from the result of a modular exponentiation for 2 prime factors, P and Q, of the public modulus N, instead of simply performing the modular exponentiation for X and N.</u>
